

Side Quest Process & Decision Document

Goal of the Work Session

I wanted to successfully implement a background, and image and some text.

What You Did

- Found an image of the Exit 8 game background, and uploaded it as the background fill. Made the canvas bigger to fill the screen.
- Found a png of a Jenga tower and uploaded it to the centre of the canvas
- Added text instruction and put it around a third of the height, made it bigger and changed colour to black
- Added a rounded rectangular shape as a banner behind the text

Decisions Made

1. Made the canvas bigger
 - Made it bigger because I wanted it to feel immersive, and having the background image as the full screen made it look like the viewer was in the game.
2. Added a shape behind the text
 - Did this to increase readability and help with contrast

Screenshot(s)

1.

```
function setup() {  
  // createCanvas(width, height) sets the size of your canvas in pixels  
  createCanvas(1600, 900);  
  
  // background() fills the canvas with a colour  
  // A single number = greyscale (0 is black, 255 is white)  
  background(exit8Img);  
}
```

2.

```
// fill() sets the inside colour of the shape
stroke(80);
strokeWeight(2);
fill(210);

// rect(x, y, width, height, cornerRadius)
// x, y = TOP-LEFT corner of the rectangle
// The last argument rounds all four corners by that many pixels
rect(width / 3, height / 4 + 15, 500, 100, 12);
```

Tools/Resources Used

- Asked professor for help

Verification

- I played the index.html file live

Challenges / Adjustments

- Setting up was the hardest part. Getting GitHub Desktop and VS Code connected took a long time, and then understanding how to run the code was very difficult. But after that it went pretty well, but I had to ask for help with setting up github pages as well.

GenAI Declaration

I did not use GenAI
